

Abstract

A vacuum cleaner includes a handle and a bottom part, the handle being swivel-mounted to the bottom part via an articulated joint. The bottom part includes at least one bottom-side suction opening, a dust chamber bounded by dust chamber walls, a fan unit, and an additional suction opening for a suction hose. A first flow path through the bottom-side suction opening and a separate parallel flow path through the additional suction opening are guided into the dust chamber via a common inlet opening formed in one of the dust chamber walls. The two flow paths are arranged in the bottom part and are guided into the inlet opening together approximately parallel to each other by a flow-guide element located between the two flow paths.
